SUMMARY

Backend developer who likes building things that actually work. I spend most of my time working with APIs, figuring out how to handle data properly, and building features like resume parsing and candidate ranking that need solid logic. I like starting projects from scratch, improving performance, and making sure they don't break in real use.

EDUCATION

B.E – Artificial Intelligence and Machine Learning

2023 – 2026

BLDEA's V.P. Dr. P.G. Halakatti College of Engineering and Technology CGPA: 7.33 / 10

TECHNICAL SKILLS

Languages: Python, Java, JavaScript

Backend: Node.js, REST APIs, JWT

Databases: MongoDB, Firebase Firestore, SQL

Tools: Git, Postman, Firebase, AWS (basic), Linux, GCP

Core: Data Structures, DBMS, Computer Networks, Operating Systems, System Design (basic)

EXPERIENCE

Full Stack Development Intern – Arlig Technologies

Jan 2024 – Apr 2024

- Built backend APIs that powered the main features of the application and handled real user data reliably.
- Designed database structures and managed data flow carefully to avoid data loss or inconsistency.
- Improved performance by refining queries and backend logic, which made API responses faster and more efficient.
- Handled API testing, validation, and error handling to ensure the system remained stable across different scenarios.
- Collaborated with the team to plan features and fix issues before they reached production.

Java & DBMS Intern – Karunadu Technologies Pvt. Ltd.

Jul 2023

- Built backend components using Java while keeping the code structured, clean, and reusable.
- Wrote and optimized SQL queries to handle structured data as it increased in size.
- Applied normalization techniques to maintain consistency and reduce redundancy in the database.
- Created reusable components that helped reduce development time for future features.
- Documented the database schema clearly so it could be easily understood and modified.

HTML, CSS & JavaScript Intern – Karunadu Technologies Pvt. Ltd.

Aug 2022 – Sep 2022

- Developed responsive web interfaces that worked smoothly across different devices and screen sizes.
- Connected frontend components with backend workflows to ensure reliable data exchange.
- Fixed UI issues and improved page load times by cleaning inefficient and redundant code.
- Worked closely with designers to turn mockups into fully functional web pages.

PROJECTS

IntelliScreen – Job Screening System

- Built a system that processes resumes and ranks candidates based on how well they match job requirements.
- Implemented matching logic using TF-IDF and cosine similarity to compare resumes with job descriptions.
- Designed the complete workflow from data extraction to scoring and final candidate evaluation.
- Added a dashboard that allows recruiters to quickly view ranked candidates without manual sorting.
- Validated the system using real data to ensure the results were accurate and meaningful.

Result Analyzer – Academic System

- Created a system to analyze student results with separate views for different types of users.
- Automated report generation using OCR to extract data from PDFs instead of manual entry.
- Added performance tracking features to simplify result evaluation for faculty members.
- Implemented role-based access so users only see the information relevant to them.
- Reduced manual effort by generating reports in seconds instead of hours.

AI-Based Interactive Robot (NAIN 2.0)

- Integrated sensors and controllers to enable real-time response and system interaction.
- Ensured stable power distribution to prevent failures during continuous operation.
- Wrote logic to process sensor data and trigger actions based on different conditions.
- Tested the system in multiple scenarios to identify and fix edge cases before final demonstration.
